

Task 7 – Basic Sales Summary using SQLite and Python

Name: Radheya Sachin Deshmukh

Objective:

To analyze product sales by building a small SQLite database, querying it using SQL inside Python, and visualizing the results using basic print statements and a bar chart.

◆ **Tools Used**

- Google Colab (Python environment)
 - SQLite (via sqlite3)
 - Pandas (data handling)
 - Matplotlib (visualization)
-

◆ **Process Overview**

1. Created an SQLite sales table in memory.
 2. Inserted sample data (Pens, Notebooks, Pencils, Erasers).
 3. Ran a SQL query:
 - Grouped by product.
 - Calculated total quantity and total revenue.
 4. Loaded result into a Pandas DataFrame and printed it.
 5. Created a bar chart using Matplotlib for revenue per product.
-

◆ **SQL Query Used**

```
sql
CopyEdit
SELECT
    product,
    SUM(quantity) AS total_quantity,
    SUM(quantity * price) AS total_revenue
FROM
    sales
```

GROUP BY
product

◆ Output Snapshot

- Table printed using Pandas & Revenue bar chart:

◆ Conclusion

This task helped in understanding how to:

- Use SQL in Python
- Summarize and visualize data
- Combine database querying with data analytics tools
